

Generate a Complex Git Command (The `git` Agent)

Screenshot of Interaction:

```
> Use the Copilot CLI's git agent to generate a command that is often tricky to remember. I committed locally but haven't pushed yet. I want to combine the last two commits into a single commit with a new message.
```

```
• Checking my documentation
  ↳ # GitHub Copilot CLI Documentation

• Based on the CLI documentation, I don't see a dedicated "git agent" but I can help you with the command you need. To combine your last two commits with a new message, use an interactive rebase:

  git rebase -i HEAD~2

This opens an editor. You'll see your two commits. Change the second commit's pick to squash (or s), save and close the editor, then edit the commit message when prompted.

Alternatively, if you want a quicker one-liner:

  git reset --soft HEAD~2 && git commit -m "Your new commit message"

This unstages the last 2 commits but keeps their changes, then creates one new commit with your message.
```

Accuracy Ranking and Justification:

I rate the response 9/10 because it correctly suggested using interactive rebase to combine the last two commits. The solution directly fixes the problem and follows Git best practices.
